Ford Ranger/Mazda BT50 Rear Bar

Whether your new ute is for work or pleasure use, or both, fitting it out with a Kaymar rear bar and carrier system makes damn good sense!

For the tradie the extra carrying capacity out the back for fuel and spare wheel leaves the ute tray free for weather sensitive tools and materials while the bar offers rear end vehicle protection against collision and reversing accidents in tight situations.

Recreational drivers will appreciate the ease of access to spare wheel and fuel once the ute tray is packed full with camping gear.

Whatever the application, all will benefit from the greatly improved departure angle once the bar is installed and the enhancement to the lines of the vehicle.

As with all Kaymar products, under the visual resides an enormously strong bar constructed under strict manufacturing quality guidelines with all components laser cut for the highest accuracy and optimum joint strength. Each welded joint is conducted using a robotic welding station ensuring perfect welds with uniform strength and finish across all welds. Once complete the entire bar receives a liberal zinc coating, sealing the steel from salt and moisture, so protecting it from corrosion and rust for many years.

Features inherent in the entire Kaymar range include rubber coated carrier locking handles, LED signal lights, gas strut assisted carrier opening and hold back, strong axle pivots with vehicle grade roller bearings, hold open lock, substantial rear end collision protection and significantly improved rear end departure angle.

Once installed, the bar serves as the base to form a comprehensive carrier system enabling the mounting of spare wheel carrier, jerrycan carrier and assorted accessory mounts. Specifically, single spare wheel, single jerrycan or combination of single spare wheel and single jerrycan. Also mounts for number plate, HF antenna, telescopic work light and hi-lift jack.
